## Preface

“A modern mathematical proof is not very different from a modern machine, or a modern test setup: the simple fundamental principles are hidden and almost invisible under a mass of technical details.” - Hermann Weyl

These notes contain short summaries of (my) proof ideas for exercises and some theorems from the book *Linear Algebra* by Peter Lax. I have tried to make the summaries as brief as possible, sometimes only one line or one equation. My hope is that the summaries will give enough information to reconstruct a full proof without bogging the reader down with details. In many cases, I am sure that I inadvertently sacrificed clarity in an attempt to obtain brevity, and would greatly appreciate any feedback.

Also, I like when people include (what they presume to be) relevant quotes from mathematicians of past generations in their notes, so I have to ask you to forgive my haughtiness in starting these notes with a quote from Hermann Weyl.

## 1 Fundamentals

### 1.1 Exercise 1

$$x + z = x = x + z' \implies z = z'.$$

### 1.2 Exercise 2

$$0x + x = (0 + 1)x = x.$$

### 1.3 Exercise 3

Coefficients can be represented as row vectors.

### 1.4 Exercise 4

Function can be represented as row vector by letting  $a_i = f(s_i)$  for each  $s_i \in S$ .

### 1.5 Exercise 5

Follows from exercises 3 and 4.

### 1.6 Exercise 6

$$y_1 + z_1 + y_2 + z_2 = (y_1 + y_2) + (z_1 + z_2) \text{ and } k(y_1 + z_1) = ky_1 + kz_1.$$

### 1.7 Exercise 7

$$a \in Y \cap Z \implies ka \in Y, ka \in Z \implies ka \in Y \cap Z.$$

### 1.8 Exercise 8

$$k0 = 0, 0 + 0 = 0.$$

### 1.9 Exercise 9

If  $S$  contains  $x_i$  then it must contain  $kx_i$ .

### 1.10 Exercise 10

If  $x_i = 0$ ,  $k_i$  can be anything.

### 1.11 Exercise 11

$$x = \sum_{i=1}^m \sum_{j=1}^{\dim Y_i} y_j^{(i)}.$$

### 1.12 Exercise 12

Complete basis for  $W$  to  $U$  and  $V$ . Use  $W$  basis vectors and additional  $U$  and  $V$  basis vectors to get  $\dim X = \dim U - \dim W + \dim V - \dim W + \dim W$ .

### 1.13 Exercise 13

Send  $i^{\text{th}}$  basis vector to  $e_i$ , where  $e_i$  is vector of all zeroes except a one in the  $i^{\text{th}}$  place. Can permute mapping to get different isomorphisms.

### 1.14 Exercise 14

$$x_1 - x_2 + x_2 - x_3 = x_1 - x_3.$$

### 1.15 Exercise 15

$$x' = x + z_x, y' = y + z_y \implies x' + y' = x + y + (z_x + z_y).$$

### 1.16 Exercise 16

$$x \in X_1 \oplus X_2 \implies x = (x_1, x_2) = (x_1, 0) + (0, x_2).$$

### 1.17 Exercise 17

Construct a basis for  $X$  from  $Y$ :  $y_1, \dots, y_j, x_{j+1}, \dots, x_n$ .  
Then  $X/Y = \text{span}\{x_{j+1}, \dots, x_n\}$ .

## 2 Duality

### Theorem 1

$$x = \sum_{i=1}^n a_i x_i \implies k_i(x) = a_i.$$

### 2.1 Exercise 1

$$l_1, l_2 \in Y^\perp \implies l_1(y) + l_2(y) = 0 = (l_1 + l_2)(y).$$

### 2.2 Exercise 2

$$\forall \xi \in Y^{\perp\perp} \implies \forall l \in Y^\perp, \xi(l) = 0 = l(y) \forall y \in Y.$$

### 3 Linear Mappings

#### 3.1 Exercise 1

$$(a) \ x \in X \implies x = \sum_{i=1}^n k_i x_i \implies T(x) = \sum_{i=1}^n k_i T(x_i) \in U.$$

$$(b) \ T(x), T(y) \in U \implies T(x+y) \in U \implies x+y \in X.$$

#### Theorem 1

$$x \in X, y \in N_T \implies T(x+y) = T(x) + T(y) = T(x).$$
